The combination of pump and attached collection media is called a sampling train. When the pump is turned on, it pulls air through the collection media and contaminants in the air are trapped for subsequent laboratory analysis. Two types of media are commonly used for industrial hygiene sampling sorbent tubes and filters. Sampling with Sorbent Tubes.

Types of Air Sampling. All industrial hygiene measurements define potential exposures. There are a variety of industrial hygiene measurements that can be employed and each vary with the types of equipment used for detection, the nature of the sampling, and the amount of time sampled within a work shift. The variety of air sampling techniques provide a professional with a different result applicable to the goal of the air sampling.

To sample worker exposure (personal sampling), diffusion-detector tubes, vapor-monitoring badges, or personal air-sampling pumps are all potential options. The most widely used and preferred option is to connect a battery operated pump to a filter medium (tubes and filters) to collect the contaminant so it can be analyzed and exposures levels determined.

In Air Quality Testing, consultants rely on laboratories to provide good quality sampling media such as filter cassettes, adsorbent tubes, IOM samplers and so on. On another hand, the laboratory relies on the client and proper shipping so as samples arrive safely without being contaminated in transit. The only way to confirm the quality of the sampling media, in shipping, and field handling is to test a BLANK SAMPLE.

Full-shift air samples for some chemicals may be collected with passive dosimeters, or by means of a pump which draws air through a filter or sorbent. Table 7-3 lists some sampling and analytical techniques used at hazardous waste sites. Selection of the appropriate sampling media largely depends on the physical state of the contaminants.
