Manual armature winding

Manual armature winding - YouTube

Armature winding can be defined as, an electrical machine in which emf can be generated because of the air gap field flux. It must be noted that the air gap is produced because of the DC current flow in the winding. In general, this winding is housed on slots of the stator & the field winding on rotor slots.

Types of Armature Winding: Lap Winding and Wave Winding

The armature (also known as the “rotor”) is a small bearing-like piece in the center of the motor construction. When it receives the magnetic force of the stator and windings, it spins, powering the motor. The windings are long coils of copper wire typically located around the stator.

If the coil span is equal to the pole pitch, then the armature winding is said to be full - pitched. In this situation, two opposite sides of the coil lie under two opposite poles. Hence emf induced in one side of the coil will be in 180 o phase shift with emf induced in the other side of the coil.

When neither pole is nearest the winding, the current through the winding is zer o. Winding. As the field continues to turn , the South Pole moves toward the winding as the North Pole moves away. Current starts to flow in the winding, but in the opposite direction, because of the opposite pole moving closer to the winding. When the Sou th Pole is
