If the wet well is cleaned when inflow rate to the pumping station is, say, half the capacity of the last pump, then the net dewatering flow rate is also about half the last pump's capacity. If the pumping station contains three pumps (one is a standby), the net dewatering flow rate would be about 25 percent of

As discussed in the pump design section, the discharge flow can be found at the intersection of the system curve and the pump performance curve. These flows will be identified as:  $Q(\text{in})$  = Inflow rate into wet well (gpm)  $Q(\text{out})$  = Discharge flow rate out of wet well (gpm)

The result was an innovative two-stage wet well and sump design concept incorporating a low-flow sump and high-flow pump wet well. The high-flow pump arrangement incorporated new Formed Suction Intakes (FSI) that reduced the size of the wetwell. Solutions.
