Focal length is the distance taken by the lens or mirror in order to be able to focus starlight. Focal length decides the length of your telescope, and the magnification given by each eyepiece (the magnification is the focal length of the telescope divided by the focal length of the eyepiece, in case you were wondering).

Telescope Buying Guide: How To Choose Your First Telescope

This telescope has a good-sized 4.5" (114mm) aperture. I'll explain more about aperture below, but in general, a wider aperture allows more light in, which leads to better image-quality. Ideally, you should look for a telescope with an aperture of at least 2.76" (70mm), which the Orion StarBlast exceeds.
